The Importance of Using Lube

After a decrease in estrogen, for any reason, bodies with vaginas can experience changes in sexual function, genital structure, and experiences of pleasure. In these cases lubricants often become a critical tool in safe, pleasurable sexual activities, as well as use with medical rehabilitation devices or physical therapy practices. Not all personal lubricants are right for everybody, and some lubes aren’t really right for any body, but it’s not always easy for consumers to access the information needed to make informed choices about safe and healthy lubricants. Folks experiencing lowered or no estrogen may have specific considerations and uses for lubricants that aren’t covered by your drug store brand products. That’s why Smitten Kitten has researched lubricants from every angle, and put together this resource for you to discover the best lubes for your body.

Our Lube Education Project

We’ve taken an in-depth look at the safety and quality of the lubricants we sell, along with similar products more widely available in drug stores, because we realized this important consumer health and safety information was not accessible… or didn’t even seem to exist!

We understand that many people are dissatisfied with their lubricant and struggle to find one to suit their needs.

Finding a lubricant that works for you can make a positive impact in the quality of your sex life and well-being. This is especially true for people with allergies or sensitivities, people who are taking antidepressants, or those experiencing hormonal changes resulting from menopause, pregnancy, hysterectomy, radiation, or chemotherapy. With all this in mind, we’ve read, researched, and compiled as much information as possible on personal lubricants for our customers and medical professionals.

Smitten Kitten’s Mission

Smitten Kitten is a progressive, sex positive, education based sex toy store and resource center for everyone.

We were the first ever totally non-toxic and body safe sex toy retailer in the world, and continue to advocate and educate for safer sex toys, supplies, and lubricants.

Our staff of sex educators receive training on everything from the newest innovations in vibrators to the effects of radiation and chemotherapy on sexual function, and provide thorough, customized customer service and education to all of our clients.

We also provide public workshops and classes specifically for medical professionals on topics around sex and sexuality, speak and teach in our local community, and facilitate workshops at conferences around the country.
What type of lube is best for you?

There are four major types of personal lubricants, classified by their primary ingredients. Each type of lube has particular strengths and weaknesses which make them better suited for specific activities, uses, personal preferences, and bodies.

<table>
<thead>
<tr>
<th>Water Based</th>
<th>Oil Based</th>
</tr>

Here’s a handy chart that explains what types of lubricant are okay to use with toys and safer sex barriers. People often get confused about which lube is safe to use with what material. But as you can see here, there are really only two incompatibility issues to worry about.

- Avoid using silicone lubricant with silicone sex toys. It’s not always an issue, but occasionally silicone lube can change the surface texture of a silicone toy and cause it to peel or look foggy and smudged.

- NEVER use oil based lubricants with latex or polyisoprene condoms, dental dams or gloves. The oil will eat right through, rendering the barrier useless! Yikes.

*Oil Based Lubricants ARE compatible with Polyurethane or Nitrile barrier methods, which are uncommon, but do exist: Trojan Supra™ Condoms (Polyurethane), MidKnight® Nitrile Gloves, or the FC2™ Receptive Condoms (Nitrile).
Take An In-Depth Look At Water Based Lube!

There are two major characteristics particular to water based lubes that are more accurate predictors of their safety than any one ingredient, which are pH and osmolality. First, we’ll take a closer look at pH. If you experience burning or stinging when you use lube, the information on this page could be really important!

What is pH?

pH is the measure of a solution’s acidity or basicity on a scale from 0-14. A pH of 0 would be the most acidic, a pH of 14 would be most basic, and a pH of 7 would be neutral. Check out the chart on the next page for examples to put this idea in a real life context. pH is important for genital and sexual health, as the pH of different environments in the body is important for maintaining balanced and healthy sexual function.

Vaginal pH

Vaginal pH plays an important role in the immune function of the vulvovaginal microbiome, as it helps maintain the balance of healthy bacteria and yeast, and acts as a defense against pathogen transmission.

pH levels fluctuate with hormonal changes: Vaginal pH naturally changes throughout the menstrual cycle and is closely tied with estrogen and progesterone levels. As the body changes with menopause, or other causes of decreased estrogen (like chemotherapy, surgery, some types of hormonal birth control, and various endocrine conditions), the pH of the vagina rises from 3.5-5.5 to closer to 6-7. This is a completely natural occurrence, and doesn’t necessarily reflect poor health; however, it does leave the genitals more susceptible to BV, UTIs, yeast overgrowth, or pathogens.

When combined with other effects of low estrogen, like thinning, less elastic tissues at the vaginal opening and in the vaginal canal, this raise in pH can create an environment where very acidic lubricants cause burning or stinging.

Using a lube that matches the body’s pH, or re-acidifying the environment with slight, incremental decreases in pH may be helpful.
The range of “normal” vaginal pH is far greater than what has traditionally been understood. Vaginal pH varies widely in relation to hormonal levels and different bacterial populations, and the range stated here accounts for normal pH fluctuations that happen over a menstrual cycle and throughout life. A higher pH correlates to lower estrogen. A pH higher than 4.5 has often been seen as an indicator of bacterial vaginosis — however, recent studies have shown that most people with vaginas can regularly experience relatively high vaginal pH without the occurrence of BV.

Using a body friendly, hydrating lubricant on a daily basis can help to maintain tissue health, mucous production, and elasticity (we often recommend a plant oil based lube if possible). Regularly stimulating the genitals with vaginal massage, play with toys or a partner, or kegel exercises can help maintain flexibility and health in the underlying muscles.
What is Osmolality?

Osmolality is the measure of dissolved particles per unit of water, shown as mOsm/kg (milliosmoles per kilogram). More simply put, osmolality is the concentration of a water based lubricant. The osmolality of a lubricant is important because the epithelial layer and the body’s natural mucus are constantly trying to maintain an equilibrium of water pressure.

We said that there are two major characteristics particular to water based lubes that are more accurate predictors of their safety than any one ingredient. The first one was pH. Now we’ll take a look at the second one, osmolality.

More Important Lube Science Facts!

When a lubricant has an osmolality similar to that of the mucus and mucous membranes of the genitals, the osmotic pressure is equalized and the cells’ integrity is not compromised. Here’s what that looks like:

ISO-OSMOTIC LUBE

When a lubricant has an osmolality far lower that of the mucus and mucous membranes of the genitals, the imbalance in water pressure can flood the cell and cause it to rupture.

HYPO-OSMOTIC LUBE

©2015 Smitten Kitten
But more often than not, water based lubes are **hyperosmotic**, meaning they have a higher osmolality than that of the body’s mucus.

Hyperosmotic lubricants dehydrate the body’s mucus and mucous membranes, and if they have a drastically higher osmolality this dehydration is so complete that the cells die and slough off, leaving the body irritated and more susceptible to infection.

On the next page you’ll see a graph that shows the osmolality of many commonly available water based lubricants, along with the average osmolality of vaginal and rectal mucus for comparison. Many products on the graph have osmolalites that are far higher than those of healthy mucus.

**If this seems like a potential health risk... that’s because it is.**

In 2012, the World Health Organization issued this advisory note: “Most commercial personal lubricants have high osmolalities (2000-6000 mOsm/kg)... the normal osmolality of female vaginal secretions is 260-290 mOsm/kg and in human semen it is 250-380 mOsm/kg... **Ideally, the osmolality of a personal lubricant should not exceed 380 mOsm/kg to minimize any risk of epithelial damage**... It is therefore recommended on an interim bases that procurement agencies should source lubricants with osmolalities of not greater than 1200 mOsm/kg.”

It’s frustrating to see so many lubricants with osmolalities beyond the recommended limits. But don’t worry, there are still safe, body friendly products to choose from.
OSMOLALITY - measured in milliosmoles per kilogram of solvent

KY® Warming Jelly 10,300 mOsm/kg
Astroglide® Liquid 8064 mOsm/kg
Maximun™ 6415 mOsm/kg
Astroglide® Glycerin & Paraben-Free Liquid 4806 mOsm/kg
Gun Oil® H2O 3925 mOsm/kg
Liquid Silk™ 3167 mOsm/kg
ID Glide® 2901 mOsm/kg
Astroglide® Gel 2299 mOsm/kg
KY® Jelly 2007 mOsm/kg
Replens™ 1491 mOsm/kg
rectal mucus 290 mOsm/kg
vaginal mucus 280 mOsm/kg
Good Clean Love™ Almost Naked 269 mOsm/kg
Sliquid® Organics Natural 106 mOsm/kg
Babelube™ 19 mOsm/kg
Slippery Stuff® Gel 13 mOsm/kg

Ingredients to Watch Out For

Every body is different and may have sensitivities or allergies to a variety of ingredients in personal lubricants, so it’s always important to read the ingredients list before putting a lube on your body! There are a few ingredients, however, that are bad news for most bodies and should generally be avoided.

**Glycerin(e)** - a sugar alcohol that has anecdotally been linked with yeast overgrowth and directly corresponds with increased osmolality. Any water based lubricant that has glycerine in its first three ingredients is more likely to be significantly hyperosmotic.

**Propylene Glycol** - a chemical derived from petroleum (aka “petrochemical”) which has been linked with BV and is a sensitizer, meaning the more you’re exposed to it the more likely you are to have allergic type reactions to it. Any water based lubricant that has propylene glycol in its first three ingredients is more likely to be significantly hyperosmotic.

**Nonoxynol 9 & Chlorhexidine Gluconate** - both of these ingredients are surface acting agents, (aka “surfactants”) which change the surface tension and permeability of cell membranes. Both are designed to kill microbes in an effort to make them sterile or antiseptic, but this purpose also kills healthy bacteria and compromises epithelial cell integrity. These ingredients, as used in lubricants, can lead to a burning or stinging sensation, and leave the body more susceptible to STI and pathogen transmission for 24-27 hours.

**Petroleum Oils** - are ideal breeding grounds for bacteria and take a long time to be cleared from inside of the body, so they’re never recommended for use as a personal lubricant.

**Polyquaternium-15** - is used as a preservative and skin adherent in a limited number of water based lubricants and spermicides. It can enhance viral activity and infectivity of HIV and potentially similar viruses, so it’s not advisable to use in situations where STI contraction or transmission is possible.

**Benzocaine** - a numbing ingredient that is a potential skin irritant. Numbing lubes can be used responsibly, but it’s important to remember to listen to the body’s pain responses. If penetration or friction is painful, numbing ingredients will not solve the problem, and the body will continue to react to pain or irritation even if the sensation has been dulled. Continuing painful activities, with or without numbing products, can actually lead to increased or chronic pain.

**Sugars** - some lubricants use sugars, like glucose, honey, or maltodextrin, for flavor, however all of these ingredients can feed yeast, dry sticky or tacky, and throw off the natural balance of the vulvovaginal environment; therefore, they’re not recommended for internal use.
